Table of content

Recap

1. Basic Widgets

Scaffold, AppBar, Text , Buttons , Icons, TextField

2. Layout Widgets

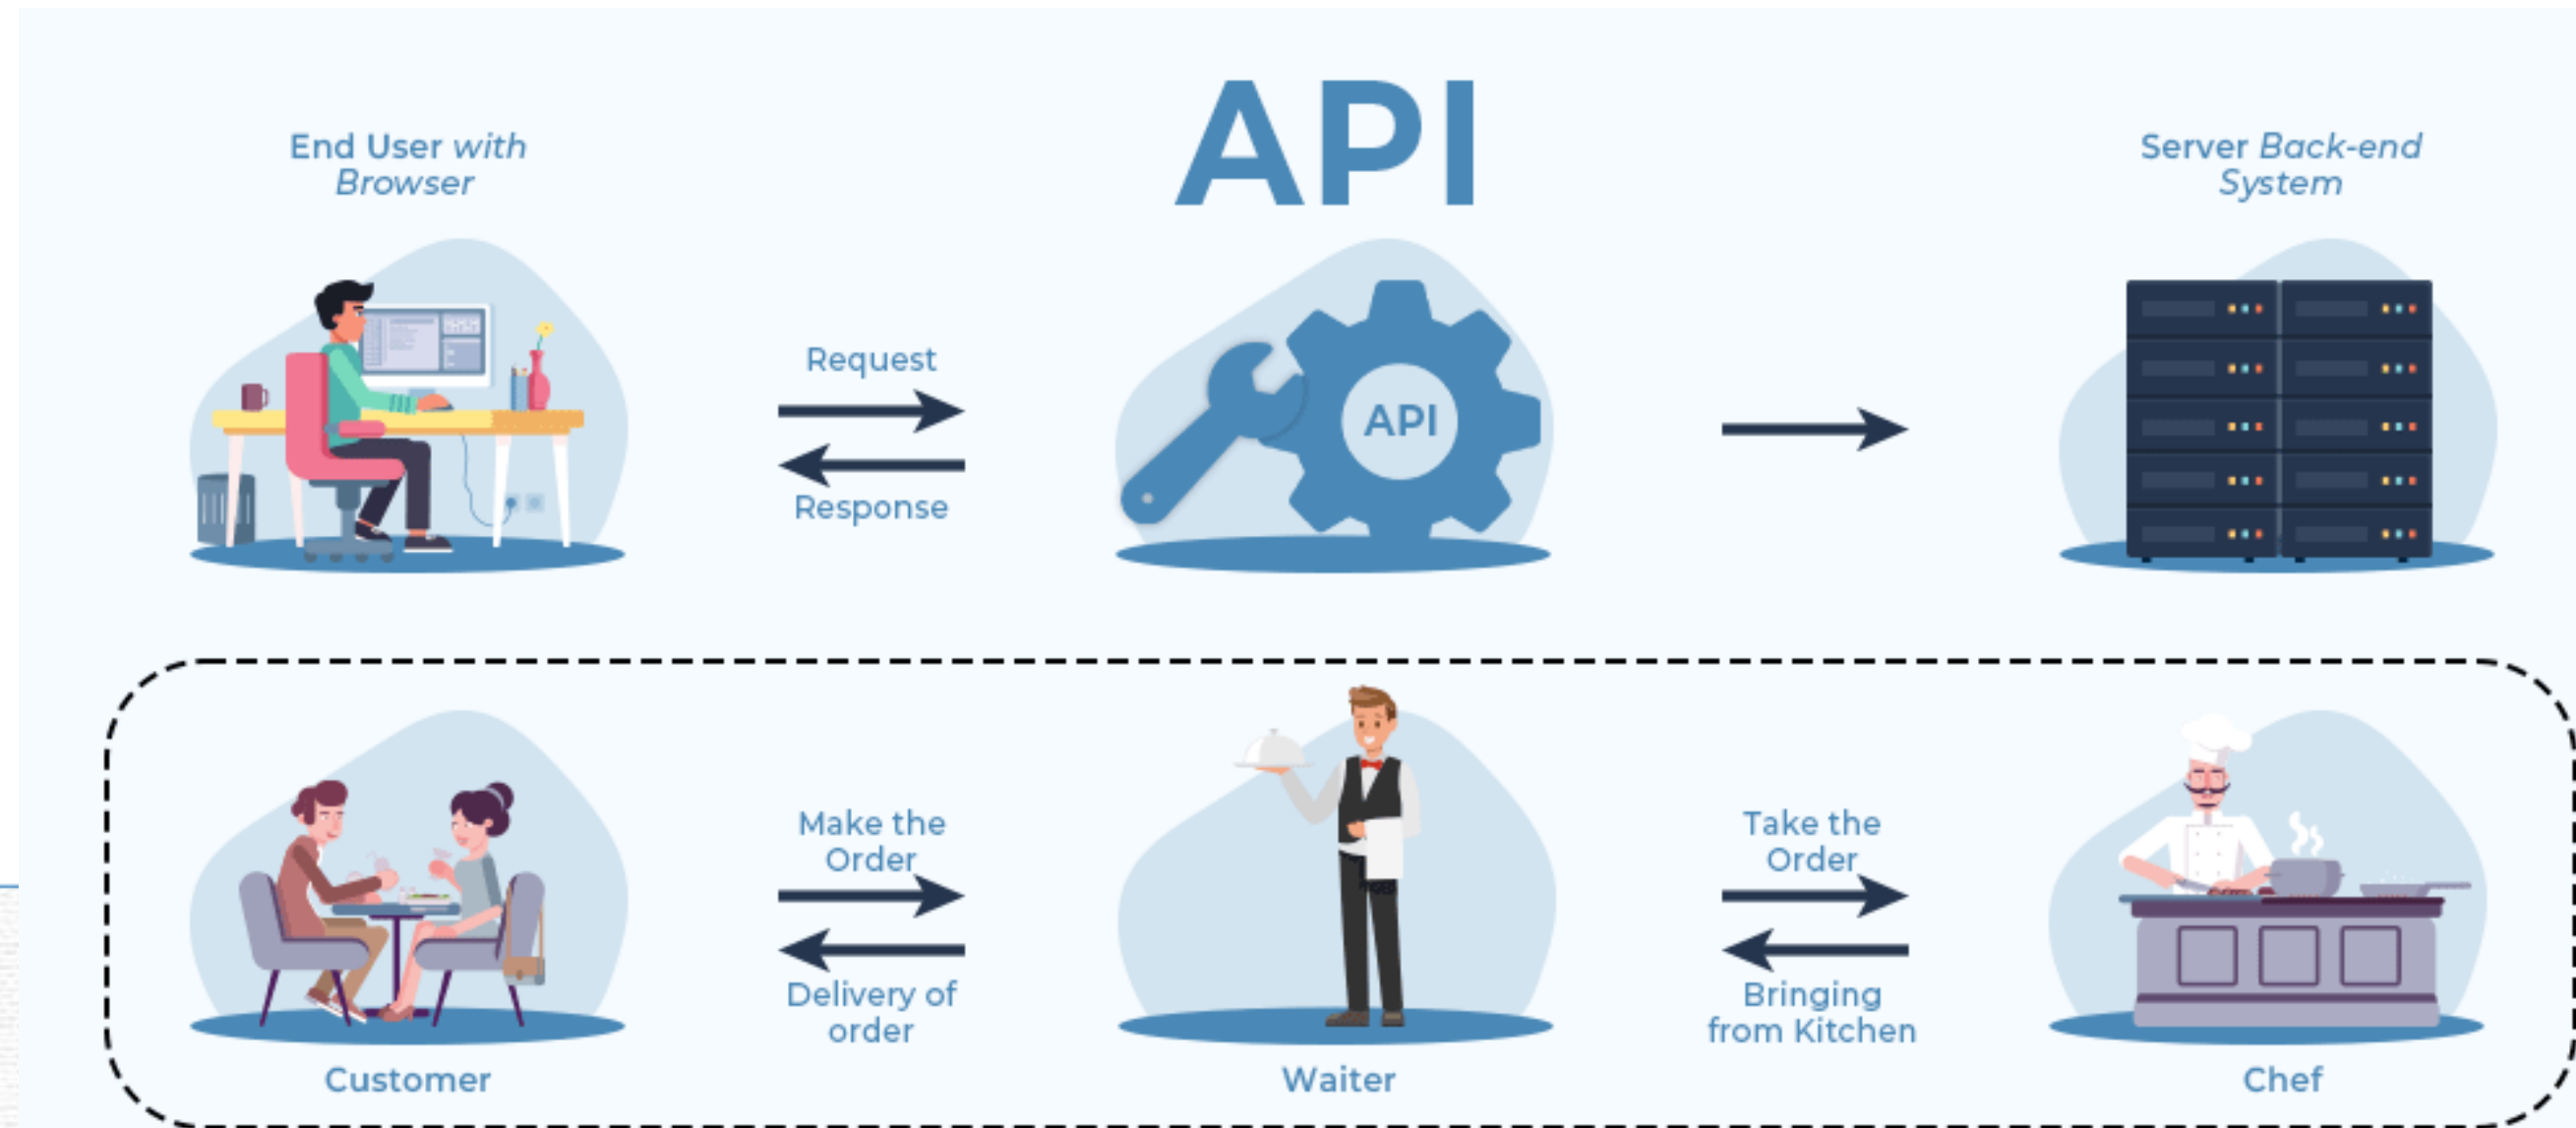

Column, Row, Container, SizedBox, Center

3. Assets

Images, Fonts, Video, Audio

api

Application Programming Interface

api methods

- GET (retrieve a record)
- PUT (update a record)
- POST (create a record)
- DELETE (delete the record)

api HTTP Codes

- 200 – OK
- 201 – Created
- 204 – No Content
- 400 – Bad Request
- 401 – Unauthorized
- 403 – Forbidden
- 404 – Not Found
- 409 – Conflict
- 422 – Unprocessable Entity (*especially in FastAPI*)
- 500 – Internal Server Error

JSON

Stands for JavaScript Object Notation.

A way to store and exchange data — like sending information between a server and an app

```
1 {  
2   "name": "Pepperoni Pizza",  
3   "size": "Large",  
4   "price": 12.99,  
5   "toppings": ["cheese", "pepperoni", "olives"],  
6   "available": true,  
7   "address": {"city": "Cairo"}  
8 }
```

JSON Structure

JSON Type	Example	Meaning	
String	<code>"name": "John"</code>	Text	
Number	<code>"age": 20</code>	Numbers	
Boolean	<code>"isStudent": true</code>	True or False	
Array (list)	<code>"skills": ["Flutter", "Dart"]</code>	List of values	
Object	<code>"address": {"city": "Cairo"}</code>	Nested information	
Null	<code>"job": null</code>	Means empty or missing info	

Api In flutter

http/dio package used for APIs

http 1.4.0 

dio 5.8.0+1 

Api In flutter

```
Run | Debug | Profile | Qodo Gen: Options | Test this function
void main() async {
  final response = await http.get(Uri.parse('http://127.0.0.1:8000/users/'));
  // ignore: avoid_print
  print(json.decode(response.body));
}
```

Api In flutter

Future

A Future means:

"I will return a value later."

It represents a value that's not available yet, but it will be in the future.

Api In flutter

```
1 Future<String> getData() {  
2   return Future.delayed(Duration(seconds: 2), ()  
3   { return "Data loaded";  
4   });  
5 }
```

This means: “Wait 2 seconds, and then return the string Data loaded.”

Api In flutter

async

You add `async` to a function to mark it as asynchronous (meaning it might take time and will return a `Future`).

```
1 Future<void> fetchData() async {  
2     print("Loading...");  
3     String result = await getData  
4     ()print(result);  
5 }
```

Api In flutter

await

You use await to pause the function and wait for the result of a Future, without freezing the whole app.

It waits for the getData() function to finish and stores the result in result.

```
1 String result = await getData  
2 ();
```

Api In flutter

Model are classes that are made to help decoding the json response to a map so it can easily be used in our app

```
class User {  
  final int id;  
  final String name;  
  final String email;  
  
  User({required this.id, required this.name, required this.email});  
  
  factory User.fromJson(Map<String, dynamic> json) {  
    return User(  
      id: json['id'],  
      name: json['name'],  
      email: json['email'],  
    );  
  }  
}
```
