## Intro to Flutter

Flutter is an open-source UI toolkit created by Google for building natively compiled applications for:

- Mobile (Android & iOS)
- Web
- Desktop
- Embedded devices

**...all from a single codebase.**

## Intro to Flutter

### Why Flutter?

**Fast Development** : Hot Reload lets you see changes instantly.

**Beautiful UIs** : Comes with rich set of customizable widgets.

**Single Codebase** : Write once, run anywhere.

**Flexible & Powerful** : Easily build complex layouts.

**Backed by Google** : Strong community & support.

## Intro to Flutter

### Flutter Is Made Of:

- **Dart** Programming Language
- **Flutter Engine** : Handles rendering, animation, etc.
- **Widgets** : The building blocks of UI

## Task

# Environment Setup

## Intro to Flutter

### Flutter Project:

#### Key Files and Folders in a Flutter

**Project/main.dart** (The Entry Point of the App)

This file contains the **main()** function, which is the starting point of a Flutter app.

Inside **main()**, we use the **runApp()** function to launch the app's UI.

```
void main() {  
  runApp(const MyApp());  
}
```

## Intro to Flutter

### 2.pubspec.yaml (Dependency & Asset Management)

This file is used to manage:

- Dependencies.
- Assets (images, fonts, icons).
- App metadata (like app name and version).

```
dependencies:  
  flutter:  
    sdk: flutter  
  
# The following adds the Cupertino Icons font to your application.  
# Use with the CupertinoIcons class for iOS style icons.  
cupertino_icons: ^1.0.8
```

## Intro to Flutter

### 3.assets/ (Images, Fonts, and Icons)

- This folder stores local images, fonts, and other assets.
- You need to declare them in **pubspec.yaml**

```
assets:  
  - images/a_dot_burr.jpeg  
  - images/a_dot_ham.jpeg
```

## intro to widgets

### 1.runApp() : (The Starting Function)

This function launches the app by passing a widget (**usually MaterialApp or CupertinoApp**).

```
void main() {  
  runApp(MaterialApp(  
    home: Scaffold(  
      appBar: AppBar(title: Text("Hello Flutter!")),  
      body: Center(child: Text("Welcome to Flutter!")),  
    ), // Scaffold  
  )); // MaterialApp  
}
```

## intro to widgets

### **2.Material vs. Cupertino (Android vs. iOS UI Design):**

Flutter provides two main UI styles:

#### **Material Design (Android Style)**

- Uses MaterialApp
- Provides Google's Material Design components (e.g., AppBar, FloatingActionButton, SnackBar).

## intro to widgets

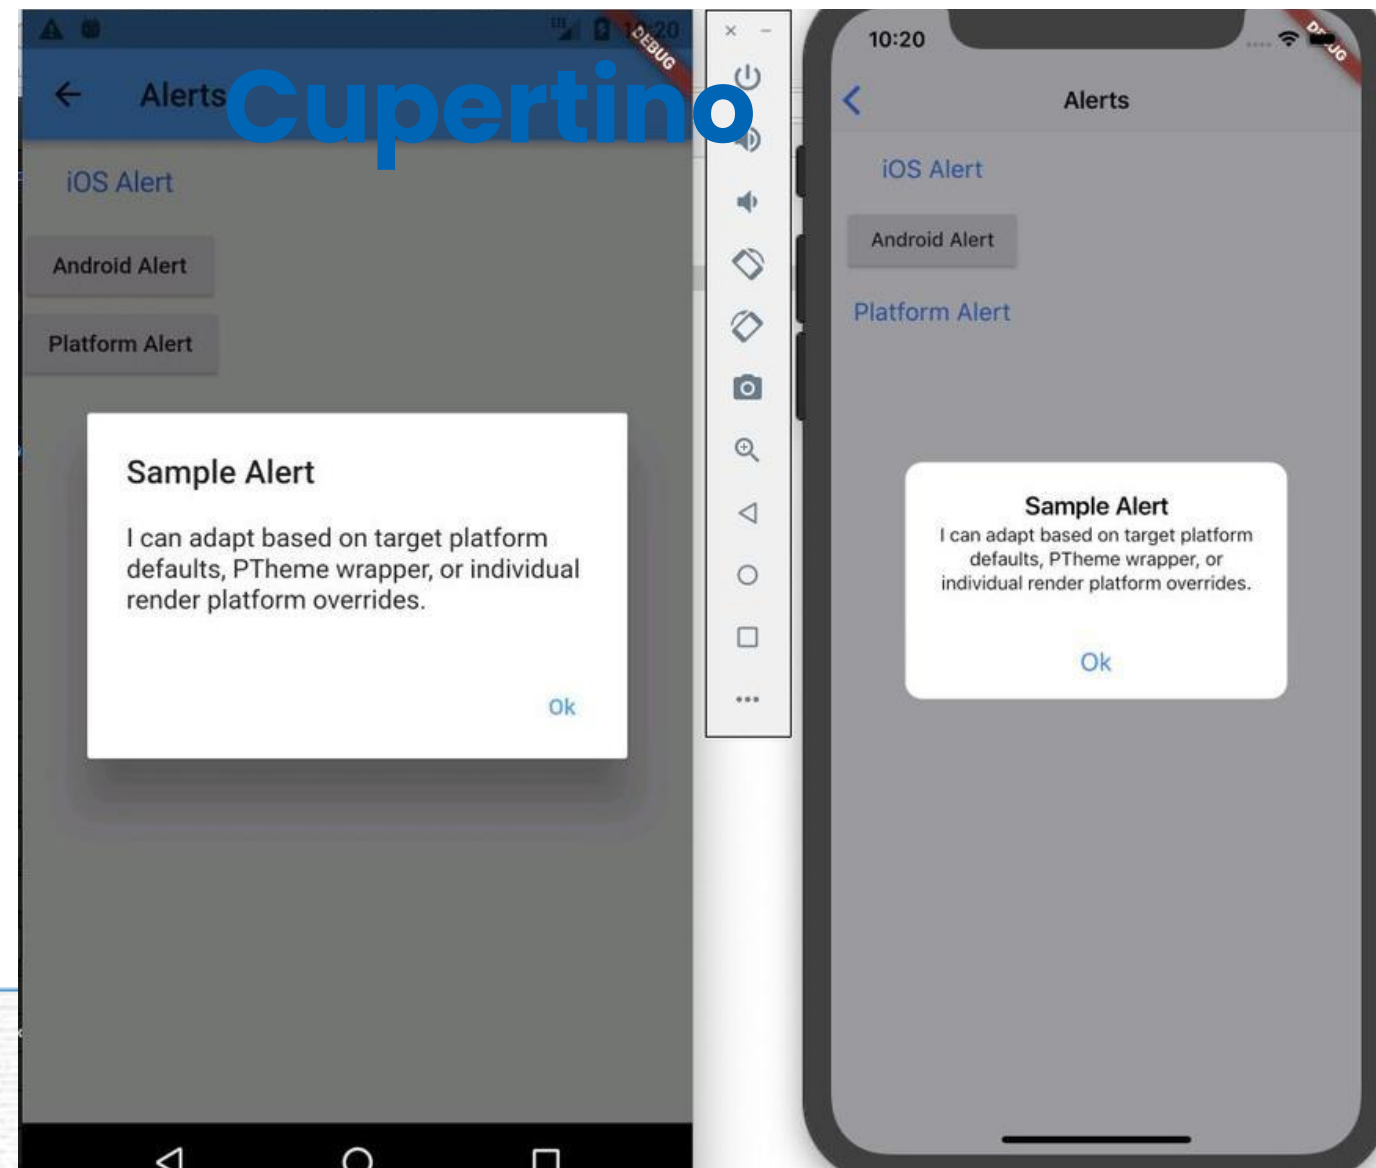

### **Cupertino (iOS Style)**

- Uses CupertinoApp
- Provides iOS-style components (e.g., CupertinoButton, CupertinoNavigationBar).

## intro to widgets

### Material vs.

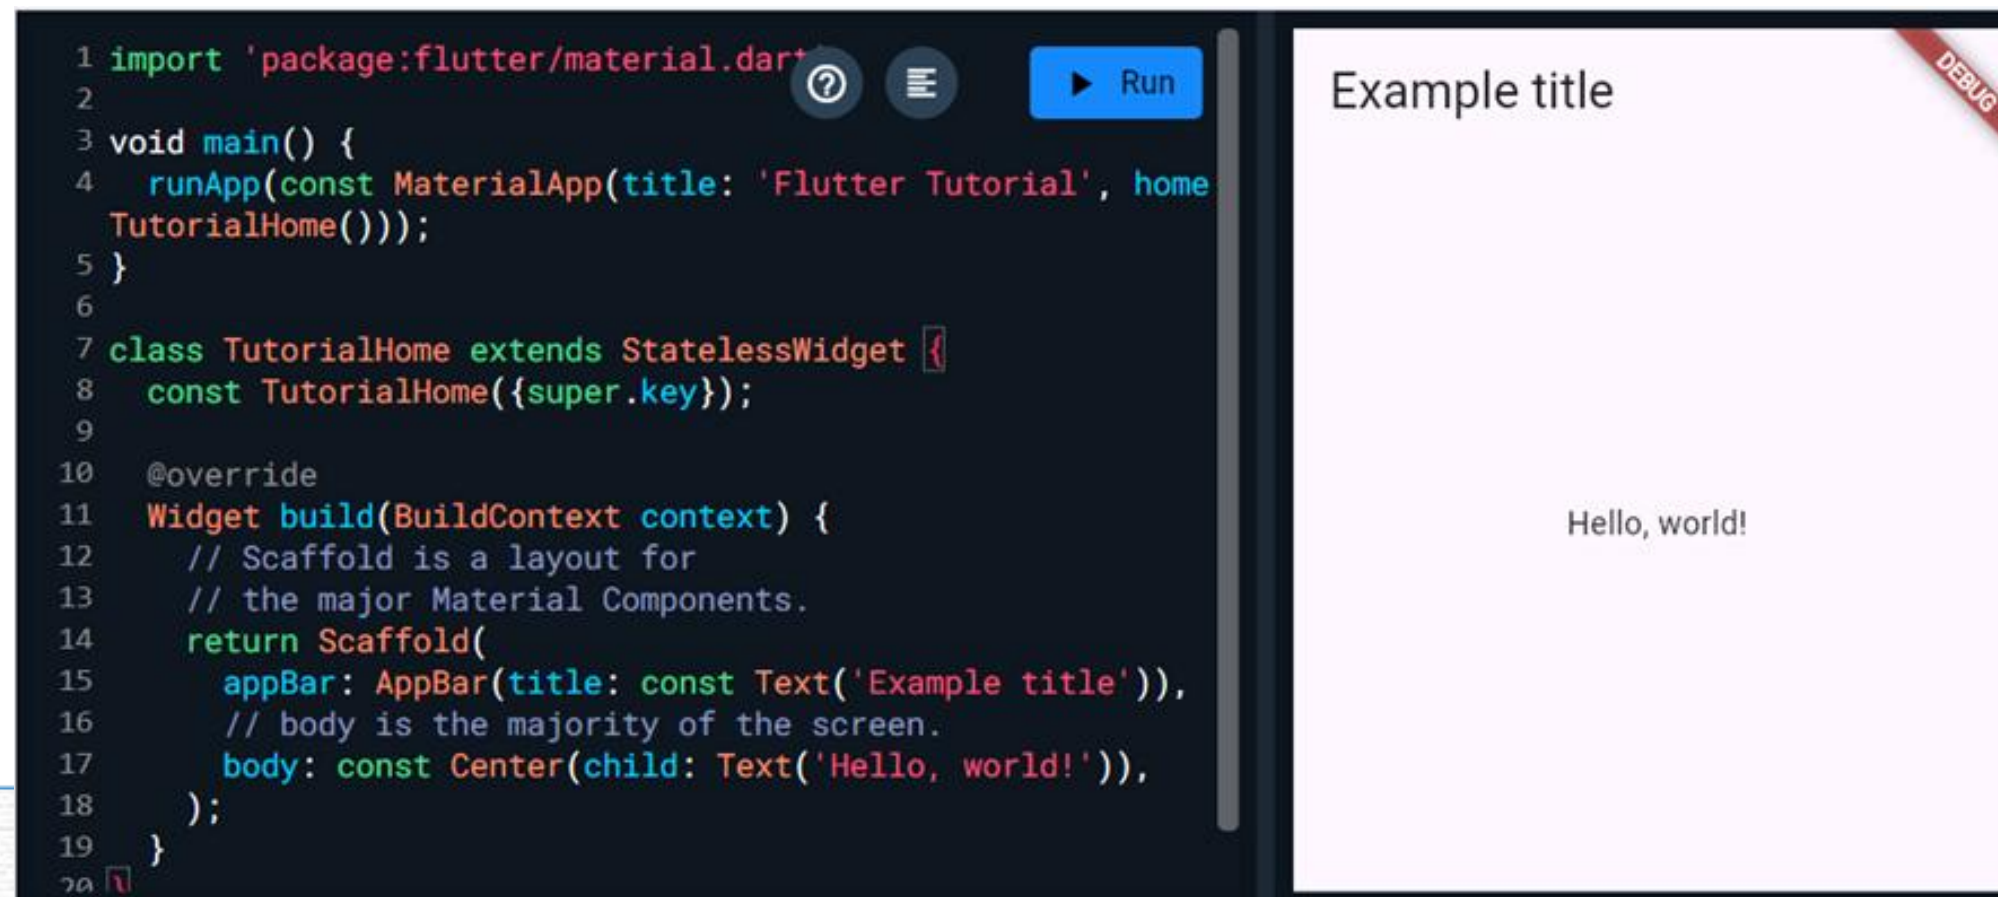

## Layout Widgets

### Scaffold Widget

Implements the basic Material Design visual layout structure.

```
1 import 'package:flutter/material.dart';
2
3 void main() {
4   runApp(const MaterialApp(title: 'Flutter Tutorial', home:
5     TutorialHome()));
6 }
7 class TutorialHome extends StatelessWidget {
8   const TutorialHome({super.key});
9
10  @override
11  Widget build(BuildContext context) {
12    // Scaffold is a layout for
13    // the major Material Components.
14    return Scaffold(
15      appBar: AppBar(title: const Text('Example title')),
16      // body is the majority of the screen.
17      body: const Center(child: Text('Hello, world!')),
18    );
19  }
20 }
```

The visual output shows a mobile app interface with a light pink background. At the top, there is a white AppBar with the title "Example title". In the center of the screen, the text "Hello, world!" is displayed. A red "DEBUG" banner is visible in the top right corner of the app preview.

## basic widgets

### AppBar Widget

A top bar to display titles, buttons, and icons.

```
AppBar(  
  title: Text("My App"),  
  backgroundColor: Colors.blue,  
)
```

## Layout Widgets

### Center

Centers its child within itself both vertically and horizontally.

```
body: Center(  
  child: Text(  
    'Hello, Flutter!',  
    style: TextStyle(fontSize: 24),  
  ), // Text  
)); // Center // Scaffold
```

Hello, Flutter!

## basic widgets

### Text

Displays a string of text with single style.

```
child: Text(  
  'Hello, Flutter!',  
  style: TextStyle(fontSize: 24),  
) , // Text
```

Hello, Flutter!

## Layout Widgets

### Column

Arranges widgets vertically

```
child: Column(mainAxisAlignment: MainAxisAlignment.center, children: [
  Text("Hello World"),
  Text("Hello World"),
  Text("Hello World"),
  Text("Hello World"),
]), // Column
```

Hello World  
Hello World  
Hello World  
Hello World

## Layout Widgets

### Row

Arranges widgets horizontally.

```
child: Row(  
  mainAxisAlignment: MainAxisAlignment.center, children: [  
    Text("Hello World"),  
    Text("Hello World"),  
    Text("Hello World"),  
    Text("Hello World"),  
  ]), // Row
```

Hello WorldHello WorldHello WorldHello World

## Layout Widgets

### Container Widget

Used for layout and styling.

Example properties: padding, margin, decoration.

```
child: Container(  
  width: 200,  
  height: 200,  
  alignment: Alignment.center,  
  decoration: BoxDecoration(  
    color: Colors.blue,  
    borderRadius: BorderRadius.circular(10),  
  ), // BoxDecoration  
  child: Text(  
    'Hello, Flutter!',  
    style: TextStyle(fontSize: 24),  
  ), // Text  
), // Container
```
